

Job Description: AI Engineer**Experience:** 2 Years**Team:** AI Center of Excellence (AI CoE)**Location:** Delhi NCR / Hybrid(WFO)

If you enjoy writing production-grade Python, arguing with your own code, and getting satisfaction from making an AI agent behave exactly the way it should — read on.

Lagozon is building a serious AI Center of Excellence focused on **real products**, not demos. We are looking for **hard-core coders** who want to work on **Agentic AI systems, enterprise copilots, and in-house AI platforms** that are used by real customers.

If your idea of AI is **engineering intelligence into systems**, you will enjoy this work.

What You Will Actually Build

- Production-grade **Agentic AI systems** with planning, memory, tool usage, and orchestration.
- Python-based backends powering Lagozon's **in-house AI products and accelerators**.
- LLM-driven workflows: RAG pipelines, multi-agent coordination, tool calling, retries, and guardrails.
- Enterprise copilots using **Microsoft Copilot Studio**, integrated with real business systems.
- AI services that talk to APIs, databases, documents, and enterprise applications.
- Reusable frameworks, utilities, and internal libraries that other teams will depend on.

Your Day-to-Day (Reality Check)

- Writing **clean, testable Python code** (most of your day).
- Debugging LLM behavior when it does something “creative” at the wrong time.
- Optimizing latency, cost, and accuracy — because AI that works but is slow or expensive is still broken.
- Reviewing code, refactoring early decisions, and improving system design.
- Working closely with senior architects who care about correctness, scale, and maintainability.

What We Expect from You

- 2 years of **hands-on coding experience**, with Python as your primary weapon.
- Strong fundamentals: data structures, APIs, OOP, error handling, and clean architecture.
- Practical exposure to **LLMs, embeddings, RAG, agents, or prompt engineering**.

- Experience with frameworks like **LangChain**, **Semantic Kernel**, **OpenAI / Azure OpenAI SDKs**, or equivalents.
- Comfort integrating with REST APIs, databases, and external services.
- Git is not optional. Neither is writing code

Bonus Points (Not Mandatory)

- Experience with **Copilot Studio**, Power Automate, or Azure AI services.
- Exposure to vector databases (FAISS, Pinecone, Azure AI Search, Weaviate).
- Understanding of cloud-native design on Azure.
- A GitHub repo that shows you actually build things.

If you can code, think, and build — we want to talk.

Degrees are good. Skill of writing good code **is even better.**
